The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inczymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed incymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well so oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV DNA. The nucleic acids may be used to modulate the expression of HBV only and compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV increasion in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ь.

```

ó

Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV, RNA stability, RNA expression, RNA synthesis, antisense, enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; zinzyme;

HCV minus strand DNAzyme substrate sequence #834.

(first entry)

24-SEP-2003

ACD62971;

HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

Hepatitis B virus.

WO200281494-A1.

17-0CT-2002

amberzyme; G-cleaver ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Brhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

Hepatitis C virus.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HHV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, amberzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV infortion and year into and year in the present vivoarious in zinzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 17;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 17 BP; 5 A; 5 C; 4 G; 0 T; 3 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4.2%;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes, incymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV campounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pavco
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Morrissey D,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3
```

Lee Ъ,

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HBV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                       HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
that modulate the expression and/or replication of HCV. The compounds methods of the invention are useful for the treatment of degenerative idisease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tumour suppression, tumour reversion, apoptosis, virus resistance,

                                                                                                                                                                                                                                                                                                                                                                                                                                                      ACC6806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip; in vitro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene othly, in vitro as (anti)sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ss; probe; human; chorionic gonadotropin; allele zygosity; polymorphism; breast cancer 1, BRCA1; single nucleotide polymorphism; SNP; parasitic disease; infectious disease; HIV; hepatitis; influenza; adenovirus; typhoid; antigen quantitation; probe.

autibody respectively specific for one or more epitopes. The antiper autibody respectively specific for one or more epitopes. The antiper molecule is a human chorionic gonadotropin (hCG) related molecule and the molecule is a alpha subunit or its variant, or a beta-subunit or its variant, and the reactant is a respective antibody. The method is useful cfor determining allele zygosity of mucleic acid molecules of a genetic locus two finucleic acid molecules of a genetic locus having two alleles. The method is useful for detecting several single mucleotide polymorphism of mucleic acid molecules of a genetic locus having multiple alleles. The genetic locus is the human breast cancer 1 (BRCA1) gene. The method is useful for detecting several single nucleotide polymorphism. The method is useful for determining parasitic and infectious diseases, human immunodeficiency virus (HIV), hepatitis, influenza, adenovirus, or typhoid The method is useful for quantitating bacterial, mycophasmal, fungal antigens and antibodies like Salmonella O antigens, or excloxins. The present sequence represents the human breast cancer 1, BRCA1, allele specific probe 5382insC-Normal.
                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of detecting several reactive sites on an analyte. The method is useful for detecting several reactive sites on an analyte such as a nucleic acid molecule. Optionally, the analyte is an antigen molecule, the reactive site is one or more epitopes on the antigen molecule, and the reactant is one or more fluorescently-labelled
                                                                                                                                                                                                                                               Detecting several reactive sites on an analyte useful for determining antigens in immunoassays, comprises reacting reactive sites with microspheres comprising reactants to form reactant-reactive site pairs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4.2%; Score 12.2; DB 1; Length 17; 82.4%; Pred. This invention relates to a method for determining whether a patient will show a hypersensitivity, or similar, reaction to abacavir by typing the patient for presence of the S7.1 ancestral haplotype of the Major Histocompatibility Complex (MHC). The ancestral haplotype is defined by presence of the human leukcoyte antigen (HLA) subtypes HLA-B*5701, C4A6, HLA-DR7 and HLA-DQ3. Human immunodeficiency virus (HIV) is the cetiological agent of a complex disease that includes progressive destruction of the immune system (Gaquired immune deficiency syndrome, AIDS) and degeneration of the peripheral nervous system. It is known that compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS. Treatment with an antiviral to a person with hypersensitivity may lead to a range of ailments and cocasionally death. Patients who have the 57.1 ancestral haplotype are at oncasionally death. Patients who have the 57.1 ancestral haplotype are at conside reverse transcriptase inhibitor (NRTI) antiretroviral drug of the unvention may be useful for identifying patients who need to be excluded from treatment with abacavir. The present sequence is that of a human sequencing and PCR amplification primer which was used for SNP detection of the presence or absence of the 57.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia;
                                                                                                                                                                                                                                  Method for the identification of subjects hypersensitive to abacavir, useful for excluding patients from treatment, comprises detecting the presence of the 57.1 ancestral haplotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

Disclosure; Page 107; 771pp; French.

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, chackedides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour superssion or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgoric animals, as recombinant polypeptides, and to prepare transgoric animals, as recombinant polypeptides, and to useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours of viral infections or diseases characterized by development of tumours or creatment of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules. potentially useful for treating diseases associated with abnormal expression of the nucleotides

fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as reperimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease on schizophrenia).

Analysis of the expression of the nucleotides can be used for disponsing the nucleotides on be used for disponsing the nucleotides on be used for disponsing the nucleotides. and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal New isolated nucleic acid molecule encoding a human angiomotin-like protein, useful for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1. New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.                                          The present invention describes the human angiomotin-like protein 1 (AMLP1). human AMLP1 has cytostatic activity, and can be used in gene therapy. The AMLP1 protein, nucleic acid molecules, antibodies, and compositions of the present invention can be used for treating or preventing a disorder associated with decreased or increased expression or activity of AMLP1. The present sequence represents a scanning oligonucleotide for human AMLP1a, which is used in an example from the

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, clentifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce suppression or reversion, apoptosis and or viral resistance, to produce combinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (AD) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                        Polynucleotides differentially regulated in response to cholesterol and adipogenesis are useful to detect and treat associated conditions such as obesity, athersclerosis, diabetes mellitus and coronary artery heart
                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a composition comprising at least one expression vector comprising a polynucleotide of the invention. The composition has morectic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and treat conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obsestly, athereclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polynucleotide differentially expressed during cholesterol homeostasis and adipogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TATA modulating factor; TMF; transcription; TATA box; promoter; HIV-1; human immunodeficiency virus-1; short arm; human chromosome 3; p12-p21;

```

```
The sequences given in AAQ49398-400 are probes which correspond to regions of the TATA modulating factor (TWF) gene. TWF is a protein of man. wt. 123-130 kD which activates transcription in most genes, esp. in human immunodeficiency virus-1 (HIV-1) by binding to the TATA box region of the promoter. TWF is encoded by the short arm of human chromosome 3 in patients having lung and other involved in trans- locations in the contract PW field.)
                                                                                                                                                                                                                                                                                                                                                                                  New protein cellular factor - capable of binding double stranded \rm HIV-1 tata region and activating gene expression of \rm HIV-LTR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymerase chain reaction; PCR; amplify; primer; D-segment; variable; heavy; domain; VH; region; J-segment; human; germline; back primers; cloning; vector; pHENI-V3; Vlambda3; light; chain; scFv; BSA; CDR3; thyroglobulin; ss.

New substd. quinoline and quinazoline cpds. - are monomers for triple helix-forming oligo:nucleotide analogues useful e.g. for treating tumours or viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a triple helix forming oligonucleotide that form a triple helix with the double-stranded DNA sequence described in AAX15195. The specification describes novel monomeric compositions which are substituted quinoline or quinazoline-based structures capable of hydrogen bonding specifically with interstrand purine-pyrimidine pairs in a double stranded Watson-Cick DNA molecule to form a triple-helix. (Updated on 25-MAR-2003 to correct PF field.)

Location/Qualifiers

comprises a purification tag and a TGF active fragment. The present sequence encodes a specifically claimed purification tag. Additionally, sequence encodes a specifically claimed purification tag. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the binding delements: purification tag:proteinase site:EWA binding cliesproteinase site:TGF-beta. TGF-beta promotes wound healing, and the proparation of artificial skin. The inclusion of a purification tag accilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site is included to permit cleavage and release of the purification tag after purificated edlivery of the fusion protein to the desired site of action. Delivery of the TGF-beta required to be administered to be effective and reduces the ö concentration of circulating TGF-beta which may result in undesirable Gaps .. 0 Score 12.2; DB 1; Length 18; Pred. Novel human Zcytor7 DNA encodes a type 2 cytokine receptor - useful for treating renal, neural, pancreatic and prostatic diseases. Farrah TM; Adams RL, Whitmore TE, Example 1; Page 62; 72pp; English. Kho CJ, Jelmberg AC, 98WO-US003029. 97US-00803305. (ZYMO ) ZYMOGENETICS INC. WPI; 1998-480798/41. Homo sapiens WO9837193-A1 18-FEB-1998; 20-FEB-1997; 02-OCT-1997; 27-AUG-1998. Synthetic. Lok S, 

Sequences shown in AAV57517 to AAV57524 represent primers used for the PCR amplification of the CDNA encoding the Zcytor7 cytokine receptor. Zcytor7 is a ligand-binding receptor polypeptide and is a novel member of the type 2 cytokine receptor family (GRF2). An expression vector containing the Zcytor polymorlective, operably linked to transcription promoter, a sequence encoding a transmembrane and intracellular domain, or both, and a transcriptional terminator can be used to transform host cells for the recombinant production of the polypeptide. The sequences can be used to study the Zcytor7 gene and to isolate ligands binding to it. Zcytor7 is preferentially expressed in the Kidney, pancreas, prostate proliferation and differentiation of cell in these organs. The antagonists and agonists of Zcytor7 can be used to stimulate antagonists and agonists can also be used in the treatment of renal, neural, pancreatic and prostate diseases

0 AAV46054 and AAV46200-V46264 are primers used in isolating human histocompatibility locus antigen (HLA-A) Class I alleles which are used in a novel method of HLA Class I typing. The method involves combining a group-specific untranslated region primer pair with a target DNA to allow primer-based amplification of the DNA, and determining whether a nucleic pair produced by the amplification. The ability of the primer pair to produce a product is associated with a particular HLA group type. The methods can be used for typing the 3 classical HLA class I genes The methods can loci HLA-A, HLA-B, and HLA-C) in e.g. donors and hosts for tissue transplantation. The initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. The subsequent sequencing can provide for high-resolution typing HLA Class I  $t_{\rm YP}$ ing - by primer-based amplification of target DNA using group-specific untranslated region primer pair. DICKINSON CO

Mycobacterium kansasii oligo:nucleotide - useful in detection of typical and atypical strains in, e.g. HIV patients.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and

                               primers AAV16798-99 are used in an arbitrarily primed PCR reaction to
                                       identify Mycobacterium kansasii KATS1 DNA sequences. KATS1 is a DNA kansasii specific. Mycobacteria other than M. kansasii specific. Mycobacteria other than M. kansasii specific. Mycobacteria other than M. kansasii samples. The KATS1 PCR product strains (see AAV16800-801) was cloned, and used to design more PCR primers and probes. Species-specific detection of M. kansasii nucleic acids can be performed by hybridising a probe to the nucleic acids and detecting the hybridisation. Alternatively, the nucleic acids can be mypridised to an amplification primer, and optionally a sequence for amplifying target nucleic acid. The amplified nucleic acids are detected. KATS1, and derived primers and probes, are used in highly specific nucleic acid hybridisation assays for detection of both typical and artypical strains M. kansasii which is an opportunist pathogen of HIV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive

evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of according to defined criteria. Also described are: (1) a method of a tNA sequence to foligonucleotides (NNS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising conteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, chemical or bioactive properties. Information gathered from assays of such compounds is used to identify nucleic acid sequences that are tractable to a variety of nucleotide sequence-based technologies, e.g. antisense drug discovery and target validation. AAZ40852 to AAZ41220, and ANX52001 to AAX52106, represent sequences used in the exemplification of the present invention

40 Identifying compounds which modulate expression of nucleic acids, used provide compounds having defined physical, chemical or bioactive properties, e.g. antisense activity.

Example 24; Page 104; 264pp; English.

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA

The present invention describes the isolation of nucleic acid (I) that encodes a protein (II) having a signal peptide (SP), which comprises isolating RNA molecules (III) that are associated with microsomes under conditions where (III) is at least partly translated. Also described are: (1) a library of (I) encoding (II) comprising SP, (2) (I) isolated by the above method; and (3) (II) encoded by (I). (I) and (II) are useful therapeutically, typically (II) are cell growth factors such as cycckines, interleukins, colony-forming factors, possibly useful in treatment of cancer. (I) are also used: as tissue and molecular weight concerns as thromosome tags; to detect possible genetic disorders; as shromosome tags; to detect possible genetic disorders; as chromosome anibodies; and in interaction trap assays to fingerprinting; to generate anibodies; and in interaction trap assays to screening, for raising antibodies (e.g. for use as immunosasy reagents) and to induce an immune response. The method is more efficient and reliable than the sequence trap system. It does not involve formation of a fusion protein (rather natural proteins are selected) and (II) do not
The present sequence encodes a peptide comprising a purification tag that was used in the creation of the bone morphogenetic fusion proteins of the invention. The bone morphogenetic fusion protein may contain some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The fusion proteins of the invention also includes proteins that have transforming growth factor beta active fragments instead of bone morphogenetic protein active fragments. The bone morphogenetic protein active fragments. The bone morphogenetic protein active fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolating nucleic acids encoding proteins comprising a signal peptide - by translating RNA and isolating translated RNA that is associated with microsomes, useful as therapeutic agents.

The present invention describes a method using novel primers involving the PCR-based determination of histocompatibility locus antigen B (HLA-B) class I group type. Determining the HLA-B class I group type of a subject comprises: (i) combining a group-specific untranslated region primer pair with a target DNA sample from the subject under conditions such that primer-based amplification of the target DNA may occur; and (ii) determining whether a nucleic acid product is produced by the amplification; where the ability of the primer pair to produce a nucleic amplification; where the ability of the primer pair to produce a nucleic and product is associated with a particular HLA group type. The method can be used for HLA-B typing. In the method, the initial group specific amplification allows a PCR based separation of haplotypes in 95% of patient samples. It permits the resolution of cis/trans linkages of patient samples. It permits which cannot be achieved with other protocols. AAX37845 to AAX38286 represent DNA sequence used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human ELK-1; p62TCF; Ets domain transcription factor protein; apoptosis; expression inhibition; infection; inflammation; tumour formation; diagnosis; phosphorothioate; antisense compound; ss.

Sequences AAZ06571-Z06607 are antisense polynucleotides targeted to a nucleic acid molecule encoding human ELK-1 (also known as p62TCF). ELK-1 is a member of the terranzy complex factor subfamily of Ets-domain transcription factor proteins. The polynucleotides inhibit the expression of human ELK-1, and this sequence targets the coding region of the ELK-1 RNA. Sequences AAZ06571-Z06607 all cause at least 30% inhibit to of ELK-1 expression. The antisense sequences can be used to inhibit the expression of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and has been shown to control various signal transduction pathways and other cell functions including apoptosis. This means that antisense compounds with its expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans and to prevent or delay infection, inflammation or tumour formation. The compounds can also be used for diagnosis, as research reagents and in kits

This invention describes a novel process for the production of a structure differentiation protein which recognises and binds with a protein having normal structure without recognising a protein having abnormal structure. The process comprises: (1) affinity chromatography of a solution containing above mentioned structure differentiation protein adsorbed fraction; (3) affinity chromatography of the cluste using a geloupled with the normal structure protein; (2) elution of the coupled with the abnormal structure protein; and (4) recovery and isolation of the structure differentiation protein in the eluate, or vice versa steps. This sequence represents a primer used in the method of the
                                                                              comprising a Bacillus species cell wall protein fused to a cleavage peptide and a heterologous protein. The fusion construct is placed downstream of a Bacillus species promoter sequence. This sequence represents a reverse oligonucleoxide coding for the (His)6 part of the construct MWPsp-MWPmpin-(His)6-Linker-Met-ProInsulin. This construct comprises the Bacillus brevis middle wall protein mp10 linked to the proinsulin protein via a cleavable linker sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer; structure differentiation protein; affinity chromatography; ss.
                                                     invention relates to a DNA construct encoding a fusion protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a DNA construct encoding a fusion protein comprising a Bacillus species cell wall protein fused to a cleavage peptide and a heterologous protein. The fusion construct is placed downstream of a Bacillus species promoter sequence. This sequence represents an oligonucleotide coding for the (His)6 part of the construct MWPsp-MWPmpl0-(His)6-Linker-Met-ProInsulin. This construct comprises the Bacillus brevis middle wall protein mp10 linked to the proinsulin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..
                                                                                                                                                                                                                                                                                                               coding a new fused protein and preparation of a useful peptide

```

The present invention describes a polymucleotide (NI) is complementary to contiguous nucleotides within 500 nucleotides of a trinucleotide repeat.

The microsatellite marker is selected from P12A7, P12B1, P32B10, P expansion mutations causing diseases such as neurological disorders e.g. dentatorubal pallidoluysian atrophy (DRPLA), spinocerebellar ataxia type 2, 3 and 4, autism, schizophrenia and bipolar affective disorder. AAA53069 to AAA53076 represent PCR primers used in an example from the The present invention describes a polynucleotide (N1) for detecting a present invention

Antisense compound for diagnosis and treatment of infection, inflammation and tumor formation is targeted towards the nucleic acid encoding a member of serine/threonine family of kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes antisense compounds of about 8-30 nucleotides in length targeted to the 5' UTR (untranslated region), 3' VTR or coding region of the nucleic acid encoding human Akt-2, which inhibits the expression of human AKT-2. Human Akt-1 is a member of the Akt/PKB family of serine/threonine kinases. The antisense compounds have antiinflammatory, cytostatic and antiiffectious activities, and can used in gene therapy. They are useful in inhibiting the expression of human Akt-2 by contacting the cells or the tissues in vitro. They can also be used for diagnosis and treatment of infection, inflammation and tumour formation, and for prophylaxis. The present sequence represents a human Akt-2 phosphorothioate anisense oligonucleotide used in the

invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

Human biallelic marker upstream amplification primer SEQ ID NO:7313.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6959 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; SRA; steroid receptor RNA activator; cytostatic; antiinflammatory; SRA inhibitor; cancer; infection; antisense oligonucleotide; ss.
                                                                 for
                                                                                                                                                                 The present sequence is one of a large number of antisense oligonucleotides which is directed against one of four human steroid receptor RNA activator (SRA) nucleic acid sequences. Two series of antisense oligonucleotides were synthesised. The first series comprised 30 oligodeoxynucleotides when a phosphorothicate backbone. The second series comprised chimeric oligonucleotides composed of a central gap series comprised chimeric oligonucleotides, which was flanked on both sides by four-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-MOE) nucleotides. Both series contained the same mucleotide sequences. The antisense compounds are useful for research, diagnosis, treatment and prophylaxis to prevent or delay infection, inflammation or tumour formation. Therapeutically the oligonucleotides are highly safe and are effectively administered to humans
                                                             Antisense compounds targeted to steroid receptor RNA activator useful diagnosis, prophylaxis and treatment of diseases associated with the steroid activator, such as infection, inflammation or tumor formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is one of a large number of antisense oligonucleotides which is directed against one of four human steroid

                               00
receptor RNA activator (SRA) nucleic acid sequences. Two series of antisense oligonucleotides were synthesised. The first series comprised 8 = 30 oligodeoxynucleotides with a phosphorothioate backbone. The second series comprised chimeric oligonucleotides composed of a central gap region, consisting of ten 2 deoxynucleotides, which was flanked on both sides by four-nucleotide wings. The wings were composed of 2 methoxyethyl (2 - MOE) nucleotides. Both series contained the same nucleotide sequences. The antisense compounds are useful for research, diagnosis, treatment and prophylaxis to prevent or delay infection, inflammation or tumour formation. Therapeutically the oligonucleotides are highly safe and are effectively administered to humans
                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; PRO polypeptide; membrane bound protein; receptor; diagnosis; transmembrane; secretion; immunoadhesion; pharmaceutical; screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                     AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAX99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences harmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention
                                                                                                                                                                                                                                                    New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions.

The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic

The sequence represents a sequencing primer used to sequence the cDNA clone encoding the Human thrombospondin-1 repeat (TSR) domain containing protein, TSRI, Members of the TSR superfamily, TSRX proteins, include proteins responsible for call attachment, spreading, motility, chroskeletal organisation, wound healing and angiogenesis. TSRX, TSRX polyucolectides and anti-TSRX antibodies are useful for diagnosing, treating or preventing cancer, theumatoid arthritis, ocular neovascularisation, wound healing, immune associated disorders and gestational diseases (e.g. pre-eclampsia). TSRX and TSRX polyucolectides can be used to identify members of the TSR superfamily, to screen for molecules which inhibit or enhance TSRX activity or function, as targets for identification of small molecules that modulate or inhibit e.g. or angiogenesis or neuronal development. Also TSRX antisense molecules or other agonists are useful for detecting and treating breast cancer. TSRX proteins can be used to screen drugs or compounds that modulate TSRX cativity or expression as well as to treat disorders characterised by the true decreases the production of TSRX forms the true decreases the production of TSRX forms the true decreases. ö that have decreased or aberrant activity compared to TSRX wild-type. Anti-TSRX antibodies can be used to isolate TSRXs and modulate TSRX activity. Portions or fragments of TSRX cDNAs are used as polynucleotide reagents and are used for tissue typing and forensic identification TSRX PRO (PRO comprising thrombospondin-I repeat) domain useful to identify molecules modulating TSRX activity or function, for treating cancer, rheumatoid arthritis and ocular neovascularization. This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP binding proteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAP94580 - AAP94637 which target a RhoA nucleotide sequence, AAP94645 - AAP94684 which target a RhoC nucleotide sequence, AAP94727 - AAP94765 which target a RhoC nucleotide sequence, AAP94777 - AAP94766 which target RhoG nucleotide sequence, AAF94790 which target a Rac 1 nucleotide sequence and AAP94795 - AAP94790 which target a Rac 1 nucleotide sequence and AAP94795 - AAP94790 which target carget in conclotide sequence and AAP94795 - AAP94809 which target carget a Rac 1 nucleotide sequence and AAP94795 - AAP94809 which target carget in conclotide sequence and AAP94795 - AAP94809 which target carget in an including conditions and ischaemia/reperfusion or reoxygenation injury. The compound may also be used to diagnose the above conditions

Determining polynuclectide expression, useful for expressing profiling or detecting single nuclectide polymorphisms, comprises hybridizing digested cDNA to a capture probe coupled to a solid particle under stringent

Claim 34; Page 29; 63pp; English.

ó The present invention relates to a method of determining polynucleotide expression, which comprises hybridising digested cDNA to a capture probe coupled to a solid particle under stringent conditions, where the capture probe is specific for the target polynucleotide and the particle dentifies the capture probe. The method is useful for expression profiling, where the presence and/or the amount of a target polynucleotide is simultaneously determined, for diagnosing a disease, condition, disorder, or predisposition associated with a change in expression patterns, in determining the developmental or physiological stree of a cell or tissue, for detecting SNPs, which may be used to state of a cell or tissue, for detecting SNPs, which may be used to disorder, and in marker assisted selection. The present sequence is a Gaps Mycobacterium differentiation; Mycobacterium detection; us-p34; Mycobacterium species-specific; upstream p34 gene region; biochip; macro-array; Mycobacterium avium-complex; MAC-complex; TUB; MOTT; Mycobacterium tuberculosis-complex; mycobacterial species; probe; non-tuberculous mycobacteria; NTM; Pseudomonas detection; ss. hybridisation tag described in the exemplification of the invention ·. The present invention relates to methods for differentiating and detecting between Mycobacterium strains in a sample based on speciesspecific upstream p34 gene region (us-p34) sequences. Also provided are new us-p34 sequences, primers and probes. The invention also relates to methods for detecting and differentiating between Pseudomonas strains. A Mycobacterium species-specific us-p34 nucleotide probe or primer is useful for producing a biochip or a micro-array for detecting M. avium-Detecting/differentially detecting Mycobacterium strain in sample, by reacting non-tuberculosis Mycobacterium species-specific upstream p34 gene region probe with sample and detecting duplexes having the probe.        mycobacteria other than M. tuberculosis-complex (TUB) (MOTT)
Mycobacterium in a sample. A Mycobacterium us-p34 nucleotide primer is
useful for detecting new us-p34 sequences in a sample. The method of the
invention identifies in a single assay, a wide range of mycobacterial
species that include members of the TUB and non-tuberculous mycobacterial
(NTM). The present sequence represents a control probe used in the
(MAC-complex) Mycobacterium species in a sample, and detecting

that causes sequence specific depurination or depyrimidination of a muleic acid (NA) without strand breakage or has sequence-specific endomuclease activity. The test sample is contacted with a substrate (II) that contains 3 NA segments. A and that are complementary and hybridise that contains 3 NA segments. A and that complementary and hybridise that contains 3 NA segments. A conditions, forming a hairpin structure and an intermediate segment B, containing a recognition motif for the activity being determined. (II) also includes a fluorophore/quencher (F/O) pair segments are hybridised, F and Q are sufficiently close to each other for segments are hybridised. F and Q are sufficiently the sample is also contacted with an agent (III) that cuts B specifically at the site where loss of a base has occurred. Any light emitted from F is then detected specifically. The method is especially used to determine activity of specifically mistletce lectin) and restriction enzymes, particularly to detect loss of activity during storage but also to dentify new, potentially therapeutic, enzymes. Some (I) are known as Detecting activity of enzymes that alter or cut nucleic acid, useful particularly for cytotoxic ribosome-inactivating proteins, from cleavage of fluorescent substrate. The invention relates to detecting an enzymatically active substance (I) Example 1; Page 13; 32pp; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of producing a recombinant polypeptide of interest, which comprises using a cost effective medium that does not contain serum or any functional (and/or recombinant) full-length protein. The medium comprises water, plant-derived peptone, osmolality regulator, buffer, energy source, amino acids, lipid source or precursor, source of iron, non-ferrous metal ions and one or more vitamins and cofactors. An example of a protein of interest is human erythropoietin (EPO). The method is useful for producing recombinant by proteins of interest. The present sequence is an oligonucleotide used in
                  of an oligonucleotide used to
                                                                                                                          Gaps

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinnucleotides within the target nucleic acid. AB209861 to AB211118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute myelogenous leukaemia, as probes for determining the cyrosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between complements, proliferation and/or molicotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between complements, propoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative cell proliferative chighly specific classification of haematopoietic cell proliferative disorders. The present method enables con highly specific classification of haematopoietic cell proliferative cell proliferative cell proliferative disorders. The present method enables con highly specific classification of haematopoietic cell proliferative disorders. The present method enables con highly specific classification of haematopoietic cell proliferative disorders. The present method enables con the contraction of particular cell proliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant protein production, vector, host cell line, erythropoietin, EPO; human, selection agent, selectable marker, PCR; primer, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recovering and purifying recombinant human erythropoietin (rhEpo) from a cell culture medium comprising host cells by the removing host cells, cellular constituents or debris and subjecting one or more fractions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of recovering and purifying recombinant human erythropoietin (rhEpo) from a cell culture medium having host cells comprising removing host cells, cellular constituents and debris from the cell culture medium by performing a procedure comprising centrifugation followed by a depth filtration step and centrifugation. The method is useful for recovering and purifying rhEpo from a cell culture medium. The present sequence is an oligonucleotide shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                             The present invention relates to a method of producing a transformed eukaryotic host cell that expresses a recombinant polypeptide of interest comprising introducing into a enkaryotic host cell first and second polymucleotide vectors that are integrated into the genome of the host cell. Particular polypeptides of interest include human erythropoietin recombinant polypeptides of interest include human erythropoietin recombinant polypeptides, such as human erythropoietin, and in producing the polypeptides. The present sequence is an oligonucleotide used in the exemplification of the invention

The present invention relates to a method of producing a polypeptide of interest, which involves culturing a hybridoma or transformed host cell a culture medium for mammalian cell culture, where the medium comprises water, buffer, energy Source, amino acids, lipid source, precursor, or iron source, non-ferrous metal ions, inorganic salts, vitamins and cofactors, and is free from each of a plant-derived or animal-derived peptone. An example protein which may be produced using the method is human erythropoiatin (EPD). The method is useful for producing a polypeptide of interest chosen from human growth hormone, human monoclonal antibodies, preferably of subclasses 1gd, 1gM and 1gA, and monoclonal human/mouse chimeric antibodies, where the transformed host cell comprises at least two polynucleotide vectors that encode different proteins of interest and where the different proteins are different proteins of interest and where the different proteins are different parts of an antibody, particularly the light and heavy chains of an antibody. The present sequence is an oligonucleotide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; PCR; secreted protein; transmembrane protein; PRO; vulnerary; cardiant; antidiabetic; anorectic; antiarthritic; angiogenesis; cancer; adrenal cortical capillary; endothebial cell growth; wound healing; stimulated T-lymphocyte proliferation; immune response suppression; neonatal heart hypertrophy; cardiac insufficiency disorder; neonatal heart capent factor; inflammation; mononuclear cell; eosinophi; diabetes; obesity; or hyper-insulinaemia; hypo-insulinaemia; sports influry; arthritis; primer.
                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for detecting and differentiating between colon cell proliferative disorders associated with at least one chewen colon cell proliferative disorders associated with at least one reagent or regions. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or a series of reagents, where the reagent or series of reagents, distinguishes between methylated and non methylated CpG dinucleotides within the target nucleic acid. The molecules of the invention demonstrate cytostatic activity whilst the method may useful for detecting and differentiating between colon cell proliferative classification between colon cell proliferative classification state of solon adenoma and colon carcinoma. The PNA (peptide nucleic acid) -oligomers are useful as probes for determining cytosine methylation state or single nucleotide of the polymorphisms. The current sequence is that of the oligomoclectide of the invention which was used to analyse the CpG positions within the genomic live methylation is not shown within the specification but is
                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting and differentiating between colon cell proliferative disorders associated with a gene or its regulatory regions comprises contacting a target nucleic acid in a biological sample obtained from the subject with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 03-NOV-1998;
```

```
The invention relates to human PRO polypeptides and the polymucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for procein electrophoresis and as therapeutic agents. The polynucleotides are useful as hybridisation probes for a CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated PRO polypeptides e.g. PRO1491 and PRO1571, useful in the preparation of a medicament for treating a condition responsive to PRO polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ferrara N, Fong S;

Watanabe CK; Fong S; Hillan KJ; Ferrara N, Gurney AL, 1 rtstein D, Desnoyers L, Eaton DL, F Ird A, Godowski PJ, Grimaldi JC, Gu NF, Roy MA, Smith V, Stewart TA, Wood WI;

Novel isolated PRO polypeptides e.g., PRO1130, PRO1275, PRO1418, PRO1555, PRO1787 affect glucose or free fatty acid (FFA) uptake by skeleral muscle cells and are useful for treating diabetes or hyper- or hypo-insulinemia.

Example 74; SEQ ID NO 256; 553pp; English

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity Length 18; 4.2%; Score 12.2; DB 1; 32.4%; Pred. No. 5.9e+02; tve 0; Mismatches 3; Query Match

82.4%;

Local Similarity 82.4 hes 14; Conservative

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity on amino acid sequence chosen from 123 fully defined sequences as given in the specification (including their extracellular domains either or without their associated signal peptides. Also include are the nuclectide (NA) sequences encoding PRO, a vector comprising the PRO NA, a host cell comprising the vector, producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an antier PRO antibody. Pro is useful as molecular weight markers for protein electrophoresis and also for chromosome identification. PRO is also

```
useful for tissue typing. PRO and PRO NA are useful as hybridisation probes for a cDNA library to isolate the full-length PRO cDNA. PRO NA is useful for generating transgenic animals or knock-out animals which are useful in development and screening useful reagents. PRO NA is also useful in development and screening useful reagents. PRO NA is also useful in gene therapy. PRO1244, PRO1250, PRO1418 and PRO1410 c useful for treating cancerous tumours. PRO1250, PRO1418 and PRO1410 c polypeptides are useful for suppressing immune response. PRO1246 and PRO1246 polypeptide is also useful for treating cardiac insufficiency disorders. PRO1246 polypeptide are useful for stimulating calcium flux in human cumbilical vein endothelial cells. PRO1250 and PRO1474 collypeptides are useful for treating bone and/or cartilage disorders of polypeptides are useful for treating bone and/or cartilage disorders (e.g., arthritis) and wound healing. PRO1130, PRO1255 and PRO1418 collypeptides are useful for treating diabetes in skeletal muscle cells and obesity. PRO1265, PRO1244 and PRO1382 polypeptides are useful for treating diabetes in skeletal muscle cells and obesity. PRO1265, PRO1244 and PRO1382 polypeptides are useful for treating diabetes. PRO1418, C disease. PRO1478, PRO1265, PRO1418, PRO1410 and PRO1575 are useful in treating thalassaemias. The present the invartion

## WPI; 2003-786999/74.

Novel isolated PRO polypeptide useful for tissue typing, modulating biological activity of cell, as molecular weight markers in protein electrophoresis, for treating arthritis, tumor.

Example 74; SEQ ID NO 256; 550pp; English

## (GETH ) GENENTECH INC.

Watanabe CK; Baker KP, Botstein D, Desnoyers L, Eaton DL, Ferrara N, Fong S; Gao W, Goddard A, Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ; Pan J, Paoni NF, Roy MA, Smith V, Stewart TA, Tumas D, Watanabe (Williams PM, Wood WI;

#### WPI; 2003-765477/72.

New isolated PRO polypeptide such as PRO1560, PRO444, PRO1018, PRO1773, PRO1244, PRO1246, useful for treating cancerous tumors, cardiac insufficiency disorders, wound healing, Crohn's disease, celiac disease.

# Example 74; SEQ ID NO 256; 555pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, PCR, primer, secreted protein, transmembrane protein, PRO, tumour, immune response, cardiac insufficiency disorder; calcium flux; umbilical vein endothelial cell; bone disorder; cartilage disorder; arthritis; wound healing, diabetes; skeletal muscle cells; obesity; Berger disease, nephropathy; Schonlein-Henoch purpura; coeliac disease; dermatitis; herpetiformis; Crohn's disease; thalassaemia; ss.
                                                                                                                                                                                                                                                                The invention relates to a method of identifying a class I or II Human Leukocyte Antigen (HLA) genotype of a subject using hybridisation and amplification assay. The method is used for determining the HLA genotype of a subject. The present sequence represents a HLA class I allele specific primer.
                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                               Identifying class I or II Human Leukocyte Antigen genotypes using hybridization and amplification assays.

predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA (Urokinase plasminogen activator). SNGG (gamma-synuclein), IDE (insulindegrading enzyme), KNSII (Kinesin-like protein 1), LIPA (lysosomal acid lypase), and TNFRSFG (Tumour Mecrosis Factor Receptor-SFG), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the chromosome 10. MI is useful for determining a predisposition for or the occurrence of, and for treating neurodegenerative disease. The genes are all located on chromosome of, and for treating neurodegenerative disease, particularly Allzheimer's disease. The present sequence is a PCR primer, which was used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; PCR; primer; secreted protein; transmembrane protein; PRO; tumour; immune response; cardiac insufficiency disorder; calcium flux; umbilical vein endothelial cell; bone disorder; cartilage disorder; arthritis; wound healing, diabetes; skeletal muscle cells; obesity; Berger disease; nephropathy; Schonlein-Henoch purpura; coeliac disease; dermatitis; herpetiformis; Crohn's disease; thalassaemia; ss.

```
The oligomer is designed to target the Human hepatitis B virus beginning at nucleotide 2605 and to covalently cross-link to it. See also AAQ20110-Q20117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New sequence-specific non-photo-activated crosslinking agents - bind to the major groove of duplex DNA and are esp. useful for treating latent infections e.g. HIV.
            Novel secreted and transmembrane PRO polypeptides useful for treating cancers, kidney disorders, Crohn's disease, diabetes mellitus, hyperhypo-insulinemia, sports injuries and arthritis.
                                                                                                                                                                                                                                                                                                                             Cross-linking oligomer 112 for targetting Human hepatitis B virus.
                                                                                 The invention relates to an isolated PRO polypeptide (secreted transmembrane protein) having at least 80% amino acid sequence
                                                                                                                                                                                                                                                                                                                                                     deoxyribonucleic acid; major groove; ethanoamino group; HBV; aziridinylcytosine; cross-linking group; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 note = "N4N4-ethanocytosine"
                                                         Example 74; SEQ ID NO 256; 548pp; English.

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is an HBV target duplex beginning at nucleotide 2605 contg. a purine-rich region

are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HIV, hepatitis, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. Additional modifications, such as altered internucleotide linkages may also be incorporated, rendering the oligomer e.g. stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)
concentrated on one chain of the duplex. The oligomer, and others like it

Sequence specific inhibition of DNA synthesis - by triplex-forming oligo:nucleotide(s), for detection of oncogene mutation(s) and treatment of e.g. HSV, Hepatitis C and Papillomavirus infection.

Claim 18; Page 57; 78pp; English

Specifically designed oligodeoxyribonuclectides form triplexes in single-or double-strand DNA at homopurine-homopyrimidine targets. These triplexes block in vitro DNA synthesis by all DNA polymerases studied, including Sequenase3, Tag, Vent, and Pol I. A similar phenomenon occurs when DNA polymerases are supplemented with accessory replication proteins, including SSB protein. Replication blockage is highly sequence-sequence or the oligonucleotide abolish the effect. Sequence-specific blocking of DNA replication in vivo is facilitated by the methods at compositions of the present invention. The present sequence is a triplex-forming oligonucleotide which targets the P gene (position 2670-2681) of hepatitis B virus

(PROF-) PROFILE DIAGNOSTIC SCI INC.

Wang C; Hepburn AG, WPI; 1999-130384/11.

Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify bacteria.

Disclosure; Col 19-20; 168pp; English.

where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of The present sequence represents a polynucleotide that is able to form a triple halix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, oncogenes and Hepatitis B virus

                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

ANALOGIST-VILLES are Larget Sequences to a now the transformer and a hybridisation region which is ribozyme contains a catalytic region and a hybridisation region which is ribozyme contains a catalytic region and a hybridisation region which is complementary to all mRNA transcribed from vertebrate genes of a specific family of closely related MHC alleles or to mRNA from a single MHC allele, and is able to cleave such mRNA. The mRNA has a target region which in case is essentially conserved in all genes of the family but differs from genes of all other MHC alleles to such a degree that no cleavage of mRNA transcribed from these other alleles occurs. This allows the selective reduction or inhibition of expression of all genes of a family or of a single gene. This ribozyme can be used for permanent or translent suppression of expression of MHC alleles, in vivo or in vitro. Specific applications are to prevent guest vs. host or host vs. guest reactions, to prevent blood incompatibilities (partic. of the ABO, rhesus and rheumatoid arthritis. The use of this ribozyme avoids the need for immunosuppressants in transplant patients. It provides very specific reduction of particular HHA molecules that cause incompatibility specific reduction of particular HHA molecules that cause incompatibility between donor and recipient. AAV10915-V11123 are target sequences for a novel ribozyme which cleaves specific alleles from the major histocompatability complex (MHC). This stribozyme contablans a catalytic region and a hybridisation region which is complementary to all mRNA transcribed from vertebrate genes of a specific family of closely related MHC alleles or to mRNA from a single MHC alleles or to mRNA from a single MHC which in case is essentially conserved in all genes of the family but differs from genes of all other MHC alleles to such a degree that no cleavage of mRNA transcribed from these other alleles occurs. This allows the selective reduction or inhibition of expression of all genes of a family or of a single gene. This ribozyme can be used for permanent or transient suppression of expression of MHC alleles, in vivo or in vitro. Specific applications are to prevent guest vs. host or host vs. guest reactions, to prevent blood incompatibilities (partic. of the ABO, rhesus and Kell systems) and to treat autolimmune diseases such as juvenile and fire themmatorial arther interval and for interval and interval and for interval and f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       need for immunosuppressants in transplant patients. It provides very specific reduction of particular HLA molecules that cause incompatibility between donor and recipient. (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme that cleaves specific MHC allele(s) - used to inhibit graft versus host reactions, to overcome blood incompatibility and to treat auto:immune disease.
Ribozyme; target; human lymphocyte antigen; HLA-A; MHC allele; major histocompatablity complex; cleavage; suppression; transplant; incompatibility; autoimmune disease; juvenile diabetes; rheumatoid arthritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Triple-helix forming region; Triplex formation; DNA detection;

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA teet sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                              Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central invervous system, cardiovascular and metabolic disorders. Phecoligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABT00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at
                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, : designed to detect single-nucleotide polymorphisms and cytosine

designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 119493; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABH00010-ABH99989 and ABI0010-ABIS2073 represent the oligomers described in the invention. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABC0010-ABC9989, ABC0010-ABC998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC09989, ABF00010-ABF99899 ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
```

SEQ ID NO 41610; 29pp + Sequence Listing; German.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at ftp.wipo.int/pub/published_pct_sequences

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABF99999, ABH00010-ABH99999 and ABI00010-ABF3073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic and molecule or the expression vector to the patient. AAX67575 to AAX75752 represent specific examples of nucleic acid molecules from the present invention

The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
